

Exercises

1. Create an DTO Layer between the Web API application and the Client (postman)

We can use the one that we created but the DataMember operation will not work on this approach (it will be basically per Access Modifiers)

2. Apply AutoMapper on the Web API
3. Research the way to make some methods for Get Operations and other for Put or Delete

Hint: Remember Http Verbs?

4. Build CRUD Operations for the different Table that exist on the Database (mapped on Entity Framework)
 - You can reuse the ones existing
 -

Extra

5. Implement Dependency Injection on the Service
 - Any C# framework is valid
